https://github.com/didiViking/Conferences_Talks

UNSPASH [Juan Puyo](#)

CONTEXT

- Transition to serverless
- Pro-active insights across multiple CSP, multiple regions
- Federated search queries across all the configured remote clusters (CCS)
- Focus on efficient aggregations with better cache results

SLA
Service Level Agreement

Promise

User Agreement when breached can cause loss/penalty

SLO
Service Level Objective

Goal

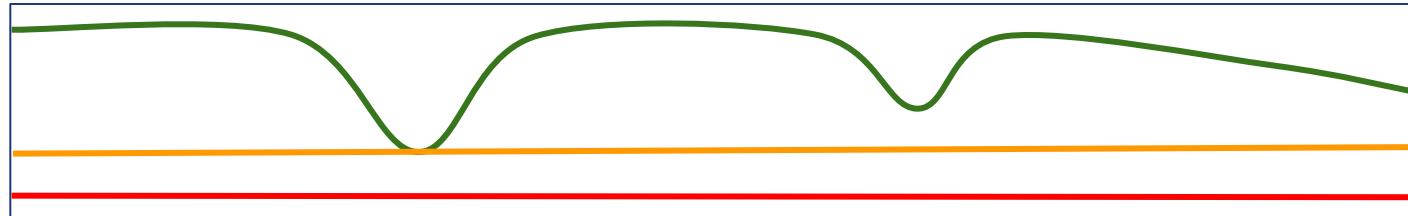

Service provider goal to defend SLA and achieve happy users

SLI
Service Level Indicator

Measurement

Metric used to measure performance

BURN RATE

ALERTS

The rate at which we are burning the error budget over a defined period of time.

Very useful for alerting before exhausting the error budget.

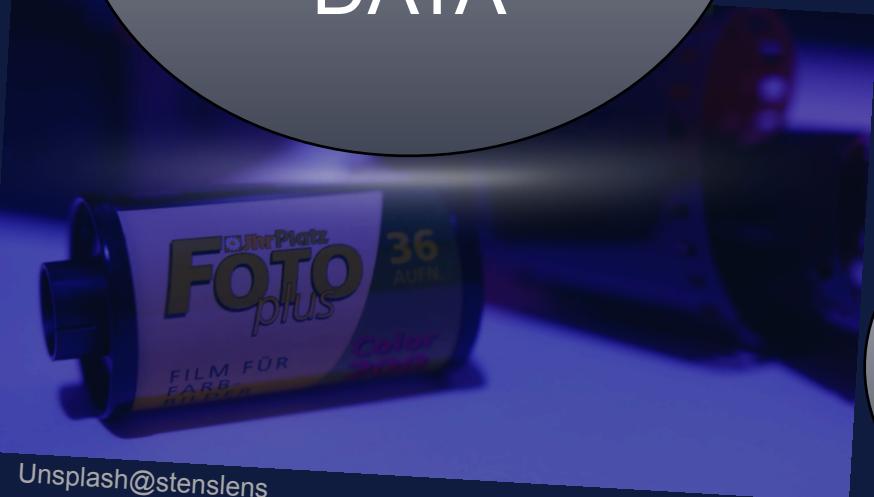

ERROR BUDGET

SERVICE

Defined as 100% minus the SLO.
Quantity of errors that is tolerated.

WHEN YOU NEED
TO SORT AGRREGATION
RESULTS BY A **PIPELINE**
AGGREGATION.

SLO Architecture

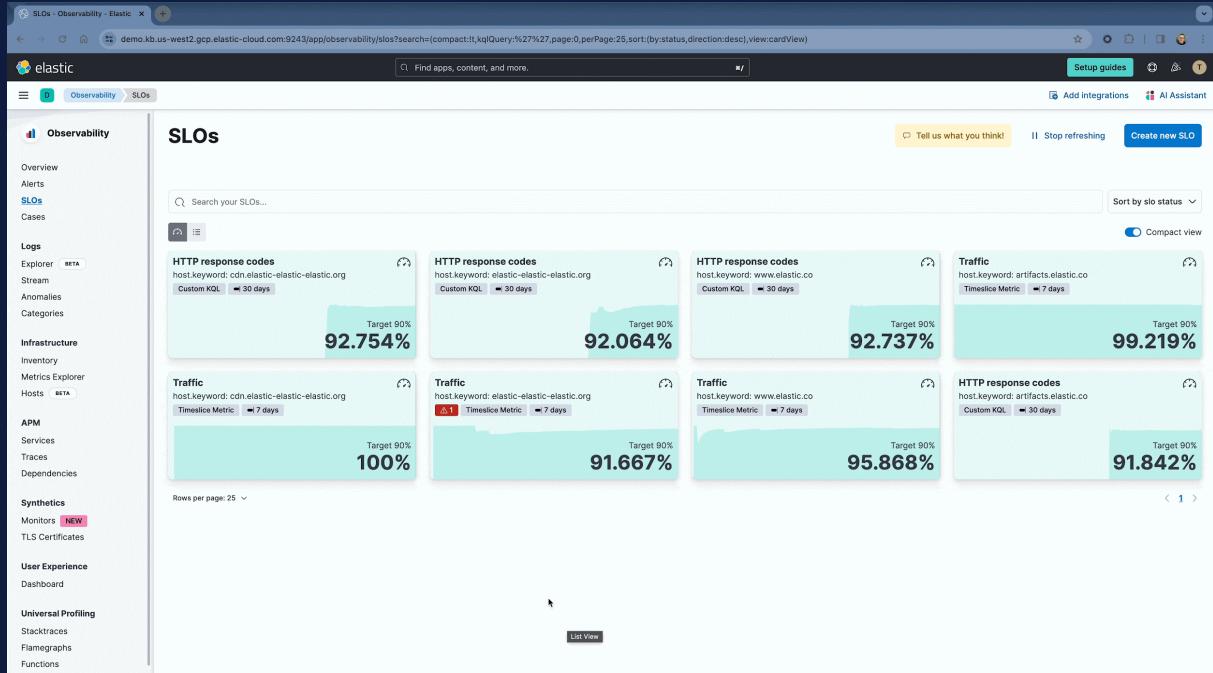

SLOs relies on the Transform service to roll-up the source data into roll-up indices.

The SLO service rolls up your data to a single document every minute and then computes a summary document based on the SLO definition and these roll up documents. By using an intermediary layer and not relying on the raw data, we can compute the SLO data faster with less storage.

SLO Overview for Observability

- Proactive and strategic approach to monitor and maintain Service Level Objectives (SLOs).
- Focused on the SRE use cases.
- Provides baseline metrics and highlight how changes affect those measurements.
- Acts as a communication layer with common language to align across teams and business goals.

TIMESLICE METRIC SLI

Grouping SLOs by a field

With SLOs, you can choose a field to group the data by. This will create multiple SLOs using a single definition. The number of SLOs created will depend on the cardinality of the field used for the group by.

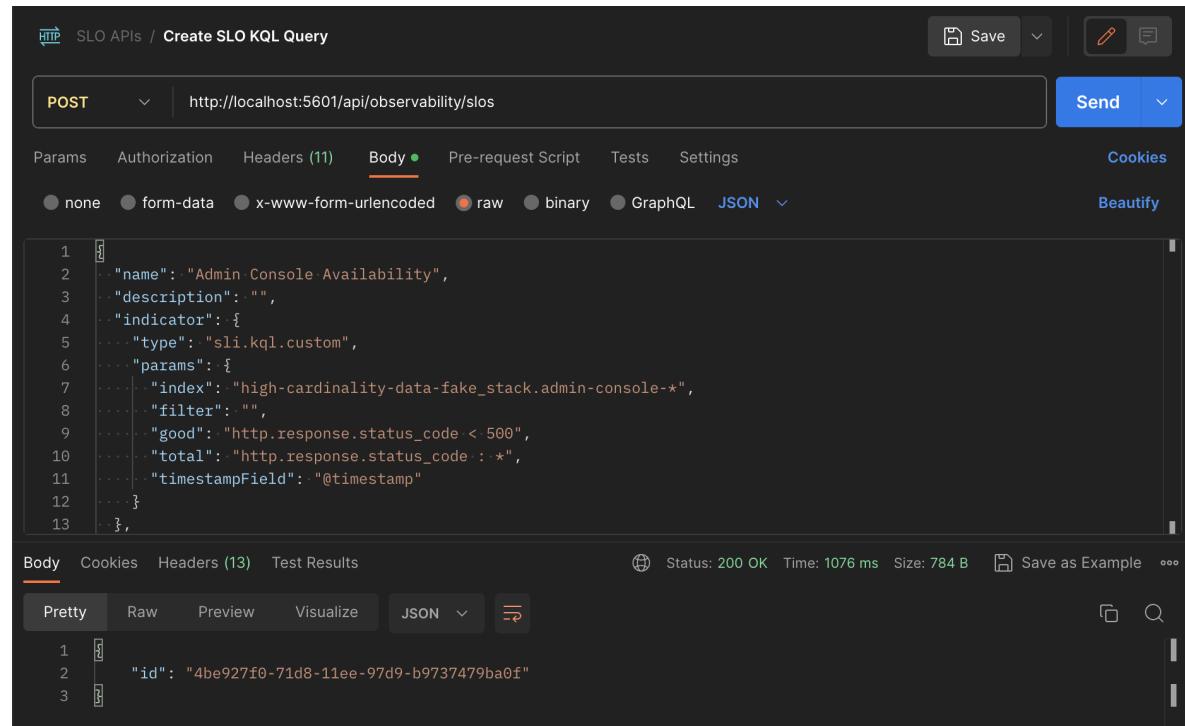

SLO API is a First Class Citizen

We built the API first, inspired by OpenSLO standard

We provide OpenAPI documentation to enable developers.

```
GET /_transforms/_all  
GET /s/{spaceId}/api/observability/slos/{sloId}
```

The screenshot shows a Postman API client interface. The URL is `http://localhost:5601/api/observability/slos`. The request method is `POST`. The `Body` tab is selected, showing the following JSON payload:

```
1  {
2    "name": "Admin Console Availability",
3    "description": "",
4    "indicator": {
5      "type": "sli.kql.custom",
6      "params": {
7        "index": "high-cardinality-data-fake_stack.admin-console-*",
8        "filter": "",
9        "good": "http.response.status_code < 500",
10       "total": "http.response.status_code : *",
11       "timestampField": "@timestamp"
12     }
13   }
```

The response at the bottom shows a single result object:

```
1  {
2    "id": "4be927f0-71d8-11ee-97d9-b9737479ba0f"
3  }
```

Status: 200 OK Time: 1076 ms Size: 784 B

BURN RATE ALERTING

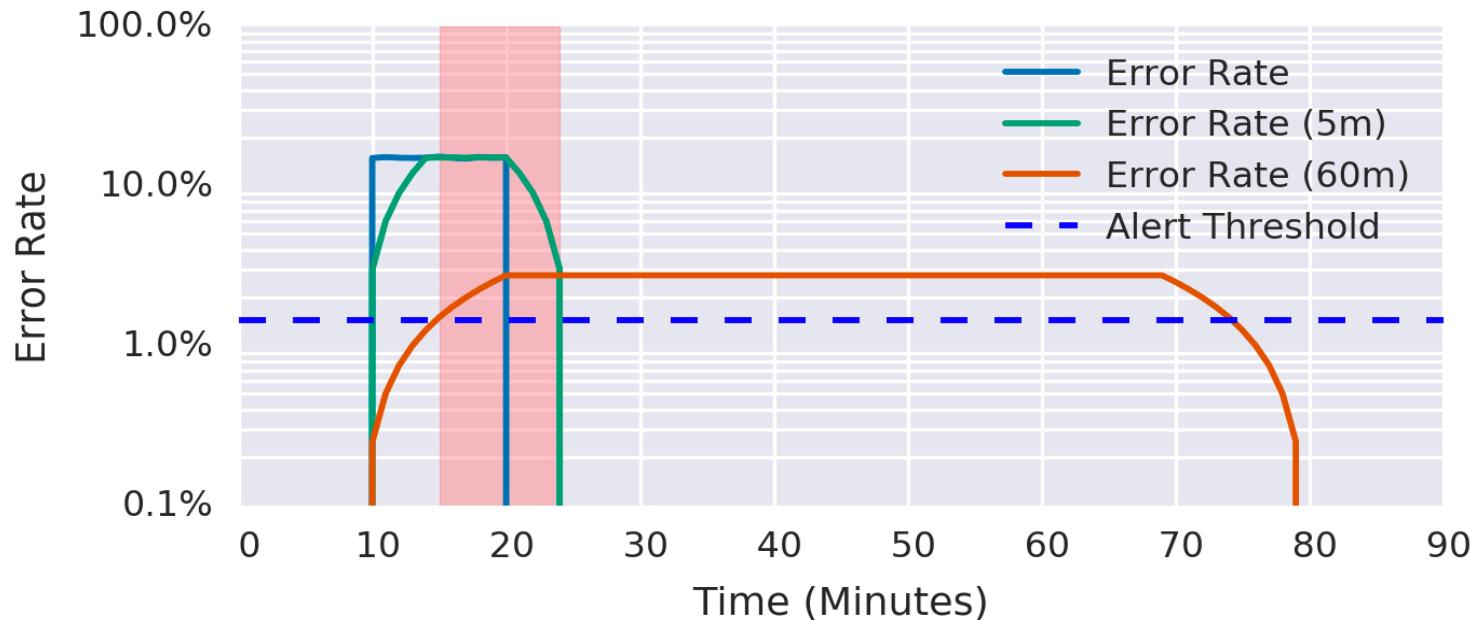

calculates the rate at which SLOs are failing over multiple windows of time.

is less sensitive to short term fluctuations by focusing on **sustained deviations**.

gives an indication of how severely the service is **degrading** and it helps **prioritize** multiple issues at the same time.

Burn rate alerting with multiple windows

For each severity, there are two windows, a short and long; the short window is 1/12 the long window. When the burn rate for both windows exceeds the threshold, the alert is triggered.

Multi-window, multi-burn rates

You can define multiple sets of windows depending on your notification strategy and how quickly you need to respond to defend the SLO.

Severity	Windows	Burn Rate	Budget consumed before alert
Critical	5m & 1h	14.4x	2%
High	30m & 6h	6x	5%
Medium	2h & 24h	3x	10%
Low	6h & 3d	1x	10%

Based on a 30 day SLO with a 99% target

Scalable, Flexible, and
deployable for the SRE
use case

SLOs Scaled for Large Enterprise

- Large Enterprise
- 100K+ of Services
- 100K+ users using those services
- 100s of users of SLO UIs
- Multi-clusters using CCS

Multiple SLO user roles

SREs, DevOps, and developers have unique perspective and focus, but share common deployment, notifications and troubleshooting.
